

MEGLADON[®]

MANUFACTURING GROUP, LTD.

Network Simulators

Network Simulators

The Megladon Difference

Regenerative Network Simulators are designed to support the entire life cycle of networking that ranges from systems prior to development, with customer support lasting up to 200k+ in a life. Typically, our software simulations provide a flexible testing platform that simulates a variety of flow based applications, flexibility network architectures can be built with any connecting gear type and length configuration, and are designed to be non-intrusive in client IT environments.

For more information on Megladon's life process and products, please visit megladon.com.

KEY BENEFITS

- Comprehensive regression testing the entire network
- Real-time simulation for system analysis in the test environment
- Extensive network observation
- Traffic capture, flow, analysis, and control with no configuration needed
- Non-intrusive in network

APPLICATIONS

- Load testing
- Troubleshooting
- Design testing
- Regenerative simulation
